PREFACE

In this modern age, computer plays an important role in our daily life. Computers are widely used everywhere for advancement and progress in our life. Mostly every field of our surrounding is depended on computers. So, all the schools and colleges are teaching computer as one of the main subject and preparing students to meet the challenges of the coming time.

This series **Computer Interface** of 8 book (I to VIII) written for the students studying in middle classes following **National Education Policy 2020** and covers every aspect which is related to computer according to the recent development in computer technology. This series is strictly written according to the latest syllabus based on the guidelines given by CBSE. Moreover the language used in this series is very easy to understand by the students, teachers and parents.

This series is designed to provide a complete knowledge with the latest information with lab exercises and more over.

We hope that students will enjoy learning computer with this series. Any suggestions for the improvement of these books will be highly appreciated.

Contents

 6.	Introduction to Flash CS3	 56
 7.	Introduction to HTML	 69
 8.	Introduction to E-mail	 80

Introduction to Computer

Lesson at a Glance

Introduction

Components of a Computer

Characteristics

Input Unit

Limitations of a Computer

CPU

Output Unit

Introduction

A computer is an electronic machine which accepts the data and instructions from the input devices, processes it into useful information and gives the desired result (output), and saves it for the future use.

A computer follows the rule of IPO (Input-Process-Output) cycle.

Which means that a computer :

- ✓ Takes data from the input devices such as keyboard or mouse.
- ✓ Processes the data by the CPU (Central Processing Unit).
- ✓ Processed data is displayed on the output device such as monitor or printer.

Characteristics of a Computer

- ✓ **High Speed** : It performs complicated calculations in a few seconds. It processes billions of instructions per second (BIPS).
- ✓ **Accuracy** : It performs/processes all the tasks without making any mistake. It commits the errors only when the wrong input is given by the user.
- ✓ **Storage Capability** : It never forgets the data/information stored in it. It can store huge amount of data which can be retrieved very quickly when ever required.
- ✓ **Diligence** : It can work continuously without any error and boredom. It can do repeated work with same speed and accuracy.
- ✓ **Versatility** : It can perform different types of work at the same time with same speed and accuracy.

- v **Reliability** : Being a machine, it does not have any emotion, like human beings.
- v **Automation** : It means ability to perform the given task automatically. Once a program is given to computer it stored in computer memory without human interaction.
- v **Reduction in Paper Work** : As data in electronic files can be retrieved as and when required, the problem of maintenance of large number of paper files gets reduced.
- v **Reduction in Cost** : Though the initial investment for installing a computer is high but it substantially reduces the cost of each of its transaction.

Limitations of Computer

- v **No Decision Making** : Unlike human beings it has no decision making power. It cannot make its own judgement and decisions by itself.
- v **Dependency** : Its functions as per a user's instruction, so it is fully dependent on human being.
- v **No Learning Power** : It has no learning process or method. Its knowledge and working conditions are limited to the program installed in it.
- v **No Emotions and Feelings** : Being a machine it does not have any feelings or emotion. It never feels pains, tiredness, etc.

Must Know!

Errors in computer are due to the presence of Virus.

Components of a Computer

All types of computers follow a same basic logical structure and perform the following five basic operations for converting raw input data into information useful to their users.

S.No.	Operation	Description
1.	Take Input	The process of entering data and instructions into the computer system.
2.	Store Data	Saving data and instructions so that they are available for processing as and when required.

3.	Processing Data	Performing arithmetic and logical operations on data in order to convert them into useful information.
4.	Output Information	The process of producing useful information or results for the user, such as a printed report or visual display.
5.	Control the workflow	Directs the manner and sequence in which all of the above operations are performed.

Must Know!

Many computers in Scientific Research Centres are working continuously for many years without being shutdown.

Input Unit

This unit contains devices with the help of which we enter data into computer. This unit makes link between user and computer. The input devices translate the information into the form understandable by computer.

Following are few of the important input devices which are used in a computer :

Keyboard

Keyboard is the most common and very popular input device which helps in inputting data to the computer. The layout of the keyboard is like that of traditional typewriter, although there are some additional keys provided for performing additional functions.

Mouse

Mouse is most popular pointing device. It is a very famous cursor-control device having a small palm size box with a round ball at its base which senses the movement of mouse and sends corresponding signals to CPU when the mouse buttons are pressed.

Joystick

Joystick is also a pointing device which is used to move cursor position on a monitor screen. The lower spherical ball moves in a socket. The joystick can be moved in all four directions. The function of joystick is similar to that of a mouse. It is mainly used in Computer Aided Designing(CAD) and playing computer games.

Light Pen

Light pen is a pointing device which is similar to a pen. It is used to select a displayed menu item or draw pictures on the monitor screen. It consists of a photocell and an optical system placed in a small tube. When the tip of a light pen is moved over the monitor screen and pen button is pressed, its photocell sensing element detects the screen location and sends the corresponding signal to the CPU.

Must Know!

Mouse was invented by Dr. Douglas C. Engelbart in 1963.

Track Ball

Track ball is an input device that is mostly used in notebook or laptop computer, instead of a mouse. This is a ball which is half inserted and by moving fingers on ball, pointer can be moved. Since the whole device is not moved, a track ball requires less space than a mouse. A track ball comes in various shapes like a ball, a button and a square.

Scanner

Scanner is used when some information is available on a paper and it is to be transferred to the computer for further manipulation. Scanner captures images and converted into the digital form that can be stored on the computer. These images can be edited before they are printed.

Digitizer

Digitizer is an input device which converts analog information into digital form. They can be used by the computer to create a picture of whatever the camera had been pointed at. Digitizer is also known as Tablet or Graphics Tablet because it converts graphics and pictorial data into binary inputs. A graphic tablet as digitizer is used for doing fine works of drawing and image manipulation applications.

Microphone

Microphone is an input device to input sound that is then stored in digital form. The microphone is used for various applications like adding sound to a multimedia presentation or for mixing music.

Magnetic Ink Card Reader(MICR)

MICR input device is generally used in banks because of a large number of cheques to be processed every day. The bank's code number and cheque number are printed on the cheques with a special type of ink that contains particles of magnetic material that are machine readable. This reading process is called Magnetic Ink Character Recognition (MICR). The main advantages of MICR is that it is fast and less error prone.

Optical Character Reader(OCR)

OCR is an input device used to read a printed text. OCR scans text optically character by character; converts them into a machine readable code and stores the text on the system memory.

Bar Code Readers

Bar Code Reader is a device used for reading bar coded data (data in form of light and dark lines). Bar coded data is generally used in labelling goods, numbering the books etc. It may be a hand held scanner or may be embedded in a stationary scanner. Bar Code Reader scans a bar code image, converts it into an alphanumeric value which is then fed to the computer to which bar code reader is connected.

Optical Mark Reader(OMR)

OMR is a special type of optical scanner used to recognize the type of mark made by pen or pencil. It is used where one out of a few alternatives is to be selected and marked. It is specially used for checking the answer sheets of examinations having multiple choice questions.

Must Know!

The use of personal computer illustrates the four operations of the information cycle : input, process, output and storage.

CPU (Central Processing Unit)

CPU is considered as the brain of the computer. CPU performs all types of data processing operations. It stores data, intermediate results and instructions (program). It controls the operation of all parts of computer.

CPU itself has following three components

- v ALU(Arithmetic Logic Unit)
- v Memory Unit
- v Control Unit

ALU(Arithmetic Logic Unit)

This unit consists of two subsections namely : Arithmetic section and Logic Section

Arithmetic Section : Function of arithmetic section is to perform arithmetic operations like addition, subtraction, multiplication and division. All complex operations are done by making repetitive use of above operations.

Logic Section : Function of logic section is to perform logic operations such as comparing, selecting, matching and merging of data.

Memory or Storage Unit

This unit can store instructions, data and intermediate results. This unit supplies information to the other units of the computer when needed. It is also known as internal storage unit or main memory or primary storage or Random access memory(RAM).

Memory is primarily of three types

- v Cache Memory
- v Primary Memory/Main Memory
- v Secondary Memory

Cache Memory

Cache memory is a very high speed semiconductor memory which can speed up CPU. It acts as a buffer between the CPU and main memory. It is used to hold those parts of data and program which are most frequently used by CPU. The parts of data and programs are transferred from disk to cache memory by operating system, from where CPU can access them.

Primary Memory (Main Memory)

Primary memory holds only those data and instructions on which computer is currently working. It has limited capacity and data is lost when power is switched

off. It is generally made up of semiconductor device. These memories are not as fast as registers. It is divided into two subcategories RAM and ROM.

RAM (Random Access Memory)

RAM is the internal memory of the CPU for storing data, program and program result. It is read/write memory which stores data until the machine is working. As soon as the machine is switched off, data is erased. RAM is volatile, i.e. data stored in it is lost when we switch off the computer or if there is a power failure.

ROM (Read Only Memory)

ROM stands for Read Only Memory. The memory from which we can only read but cannot write on it. This type of memory is non-volatile. The information is stored permanently in such memories during manufacture. A ROM, stores such instructions that are required to start a computer.

Secondary Memory

This type of memory is also known as external memory or non-volatile. It is slower than main memory. These are used for storing data/Information permanently. CPU directly does not access these memories instead they are accessed via input-output routines. Contents of secondary memories are first transferred to main memory, and then CPU can access it. For example : disk, CD-ROM, DVD etc.

Control Unit

This unit controls the operations of all parts of computer but does not carry out any actual data processing operations. It communicates with Input/Output devices for transfer of data or results from storage.

Output Unit

Output unit consists of devices with the help of which we get the information from computer. This unit is a link between computer and users. Output devices translate the computer's output into the form understandable by users.

Following are few of the important output devices which are used in a computer:

Monitors

Monitors, commonly called as Visual Display Unit (VDU), are the main output device of a computer. It forms images from tiny dots, called pixels that are arranged in a rectangular form. The sharpness of the image depends upon the number of pixels.

Printers

Printer is an output device, which is used to print information on paper.

There are two types of printers:

- v Impact Printers
- v Non-Impact Printers

Impact Printers

The impact printers print the characters by striking them on the ribbon which is then pressed on the paper. Example :

Dot Matrix Printer

Line Printer

Non-impact Printers

Non-impact printers print the characters without using ribbon. These printers print a complete page at a time so they are also called as Page Printers.

These printers are of two types

- v Laser Printers
- v Inkjet Printers

Laser Printers

These are non-impact page printers. They use laser lights to produce the dots needed to form the characters to be printed on a page.

Inkjet Printers

They print characters by spraying small drops of ink onto paper. Inkjet printers produce high quality output with presentable features. Colour printing is also possible.

A Tick (3) the correct option.

(NEP) Analytical Skills

1. The process of entering data and instructions into the computer system.
(a) Processing ☐ (b) Take Input ☐ (c) Take Output ☐ (d) Storage ☐
2. Performing arithmetic, and logical operations on data in order to convert them into useful information.
(a) Storing ☐ (b) Memory ☐ (c) Processing ☐ (d) Digitizing ☐
3. It is mainly used in Computer Aided Designing (CAD) and playing computer games.
(a) Scanner ☐ (b) Track ball ☐ (c) Printer ☐ (d) Joystick ☐
4. It is an input device that is mostly used in notebook or laptop computer, instead of a mouse.
(a) Scanner ☐ (b) Track ball ☐ (c) Printer ☐ (d) Joystick ☐

B Fill in the blanks.

1. _____ is an input device which converts analog information into digital form.
2. _____ is a device used for reading bar coded data in form of light and dark lines.
3. ALU unit consists of two subsections _____ and _____.
4. _____ can store instructions, data and intermediate results.

C Write T for True or F for False.

1. Printer is an input device which works more like a photocopy machine. ☐
2. Optical Character Reader is an input device used to read a printed text. ☐
3. The emissive displays are devices that convert electrical energy into light. ☐
4. Dotmatrix printers are the printers which print one character at a time. ☐
5. Laser printer are non-impact page printers. ☐

D Answer the following questions.

1. Write down the characteristics of a computer.

2. Explain different types of printers.

3. What are the Components of a Computer?

4. Explain about CPU.

5. Define Cache Memory.

E Match the followings.

Digitizer

OCR

MICR

Cache memory

Bar Code Reader

OMR

W o r k s h e e t

(NEP) Creative Learning

■ Name the following images:

Artificial Intelligence

Lesson at a Glance

What is Intelligence?

Are Computer Smarter

Differences between Human and Artificial Intelligence

Human Intelligence

Similarities between Humans and Machine

Artificial Intelligence

Artificial Intelligence (AI) refers to the simulation of human Intelligence and machines that are programmed to think like humans and mimic their actions. The term may also be applied to any machine that exhibits qualities associated with human mind such as learning and problem solving.

What is Intelligence?

The ability to calculate, reason, perceive relationships and analogies, learn from experience, store and retrieve information from memory, solve problems, comprehend complex ideas, use natural language fluently, classify, generalise and adapt new situations is known as intelligence.

Some of the forms of Intelligence are as follows:

- The ability to understand to understand and use spoken and written language.
- The ability to recognize and create musical pitch, rhythm, timbre and tone.
- The ability to think logically, reason and identify connections.
- The ability to accumulate visual information, change it, and re-create it without referring to the objects.
- The ability to learn by doing, exploring and discovering.
- The ability to know our strength, weaknesses, value and morals.
- The ability to manage, connect with the people, manage masses, easily adapt to social situations, understand the behaviour of other people.
- The ability to identify, classify and manipulate elements to the environment, objects, animals or plants.

You can say that a machine or a system is artificially intelligent when it is equipped with at least one form of intelligence.

Human Intelligence

Human brain is one of the most intricate and mysterious organs of the human body. It is extremely powerful and also capable of the following functions:

- Learn from different experiences
- Understand complex concepts
- Apply logic and reason to solve mathematical problems
- Recognise patterns
- Make inferences and decisions
- Retain information
- Communicate with other human beings through different parts of the body.

We are unique because of our emotions like self-awareness, passion and motivation that enable us to accomplish complex cognitive tasks.

Must Know!

The human brain weighs 3 pounds (1.36kg). It comprises 60% of fat and is one of the fattiest organs in the human body. Of the total blood and oxygen that is produced in our body, the brain gets 20% of it.

Artificial Intelligence

Artificial intelligence focuses on building smart machines that are capable of performing a wide range of tasks which usually requires human intelligence and cognition.

These intelligent machines are infused with the capability of:

- learning from experience and historical data
- performing actions accordingly
- analysing their surrounding environment
- recognise patterns
- recognise faces and objects

Are Computer Smarter?

It is true that computers become smarter and more sophisticated over time.

Computers that are close to human beings are represented as a possible threat. For example, movies like Terminator, Matrix where the world is dominated by computer equipped with artificial intelligence. These days computers are equipped with brains made by humans with a vision that one day these machines will surpass its creators. Though the progress is slow they are moving in their intelligent activities and capabilities.

Similarities between Human and Machines

Nowadays, machines have various qualities similar to humans in various aspects.

Some of them are as follows:

- Just like people, machines can learn too.
- They gain knowledge and then they learn how to improve and enhance themselves based based on the acquired facts.
- Humans have a natural tendency of understanding a situation and take actions accordingly.
- Both of them have memories to store information.
- Humans use eyes for vision, whereas machine used cameras. Both can sense the obstacles and can move on their own.
- Machines and humans can converse with each other. Humans use language for conversation and machine use natural language processing for conversation.

Differences between Human and Artificial Intelligence

Following table shows some differences between human intelligence and artificial intelligence:

Human Intelligence	Artificial Intelligence
Created by nature	Created by human intelligence
Process information slower	Process information with high speed
Less accurate	More accurate
Capable of adapting changes	Can't easily adapt changes
Has a capacity of multi-tasking	Perform single task more efficiently
Humans are social by nature	Lack social skills
Has self-awareness	Work is going on to develop this skill

A Tick (3) the correct option.

(NEP) Analytical Skills

1. The ability to calculate, reason, perceive relationships and analogies is known as:

- (a) Exploring ☐ (b) Intelligence ☐
 (c) Generalise ☐ (d) Accumulate ☐

2. It is one of the most intricate and mysterious organs of the human body.

- (a) Eyes ☐ (b) Nose ☐
 (c) Brain ☐ (d) Heart ☐

3. Which of the following is not the part of intelligence?

- (a) Storing and retrieving information ☐ (b) Learning from experience ☐
 (c) Touching any object ☐ (d) Solving problems ☐

4. Machines and humans can _____ with each other.

- (a) Fight ☐ (b) Converse ☐
 (c) Love ☐ (d) Eat ☐

5. Human brain is capable of _____

(a) Solving mathematical problems

☐

(b) Recognising information

☐

(c) Retain Information

☐

(d) All of the above

☐

B Fill in the blanks.

1. _____ is the ability to think logically, reason and identify connections.
2. Intelligence is the ability to learn by _____, _____ and _____.
3. Intelligent machines are infused with the capability of _____.
4. _____ are close to human beings are represented as a possible threat.
5. Both humans and machines have _____ to store information.

C Write T for True or F for False.

1. Humans have vision but machines does not have vision. ☐
2. Humans have a natural tendency of understanding a situation and take actions accordingly. ☐
3. AI machines can process huge information in much more faster speed than human beings. ☐
4. AI machines lack at social skills. ☐
5. Just like people, machines can learn too. ☐

D Answer the following questions.

1. What is Artificial Intelligence?

2. Write some features of Artificial Intelligence.

3. Write any two capabilities of human brain.

4. Write any two similarities between human intelligence and artificial intelligence.

5. Write any two differences between human intelligence and artificial intelligence.

Work sheet

Analyse the given task given below. Put a tick in the correct column.

(NEP) Computational Learning

Task	For Humans	For AI Machines
Identify of Animals		
Identify of Cloths		
Playing Games		
Solving problems		
Identify emotions		
Making Friends		
Identify voice		
Helping people in danger		
Helping in finding places		
Helping in daily work		

Match the text boxes with the pictures correctly.

(NEP) Creative Learning

I am based upon common sense, judgment, creativity, etc.

My decision-making capability is unbiased.

I am natural and can adapt to a change easily.

I can solve any complex problem very fast.

LAB ACTIVITY

Open MS-Word and write a short paragraph on the topic:

(NEP) Experimental Learning

“Is Artificial Intelligence Machines are helpful for human beings”.

QUICK, DRAW! WITH GOOGLE

Quick, Draw! is a free online game developed by Google. This game prompts players to quickly draw six different objects. It gives 20 seconds to the player to draw the prompt. As you start to draw the object, Quick, Draw! starts yelling out words and phrases it thinks you are trying to illustrate.

How to play Quick, Draw!

To start this game, you need a computer with Internet connection.

1. Click on Start icon to open Start menu.
2. Click on Microsoft Edge.
3. You can also open Microsoft Edge by clicking on its icon in the taskbar.
4. Microsoft Edge window appears.
5. Click on address bar and type: <https://quickdraw.withgoogle.com>

Quick, Draw! page appears.

6. Click on Let's Draw! Button to start the drawing game.

New screen appears, which prompts you to draw a picture of the object it suggests within 20 seconds. In this example, it prompts you to draw a clock.

7. Click on Got It!.

New screen appears.

8. Draw the picture (clock) with mouse (on desktop) or with finger (on Tablet or smartphone). As you draw, Quick, Draw! will start speaking out and showing up the guesses about your drawing.

After 20 seconds, next screen appears and prompts you to draw second picture.

9. Repeat steps 6 and 7 to draw the picture.

Once you have completed six suggested drawings, you can check your result.

In this example, 3 out of 6 pictures are correct, according to Google.

9. Click on Play Again button if you want to play more.

Once you draw the pictures, Google stores them in its dataset. The Quick, Draw! dataset is a collection of millions of drawings, and you can be one of the contributors to the dataset for AI.

Your drawings help developers train new robots or AI-enabled machines.

Working in MS-Word 2013

Lesson at a Glance

Lists

Bullets and Numbers

Multilevel Lists

Table

Lists

A list in Microsoft Word is a series of items preceded by a bullet or number. You can apply bullets or numbers to a list, as well as modify the bullet type or numbering format to suit the requirements of the document.

There are three types of lists that you can create in MS-Word : bulleted, numbered and multilevel.

Items in a bulleted list are preceded by a bullet or other symbol. Items in numbered lists are preceded by a number or letter. Multilevel lists are hierarchical and items may be preceded by a symbol, number or letter.

Bullets and Numbers

Bulleted lists are used for items that have no particular priority, such as a list of features or facts. They have only one level and each item is preceded by a bullet or other symbol.

Numbered lists are used for items that have a sequence or priority, such as a series of instructions. They can also be used for identification, so that the item can be referred to easily.

Bullets

You use bullets when making lists :

- This is a bullet > This is a bullet

To create a bulleted list :

1. Select the text you want to format as a list.

2. On the Home tab, click the drop-down arrow next to the Bullets command. A menu of bullet styles will appear.

3. Move the mouse over the various bullet styles. A live preview of the bullet style will appear in the document. Select the bullet style you want to use.

4. The text will be formatted as a bulleted list.

To use a symbol as a bullet :

1. Select an existing list you want to format.

2. On the Home tab, click the drop-down arrow next to the Bullets command. Select Define New Bullet... from the drop-down menu.

3. The Define New Bullet dialog box will appear. Click the Symbol button.

4. The Symbol dialog box will appear.

5. Click the **Font** drop-down box and select a font. The **Wingdings** and **Symbol** fonts are good choices because they have many useful symbols.

6. Select the desired symbol, then click OK.

7. The symbol will appear in the Preview section of the Define New Bullet dialog box. Click OK.

8. The symbol will appear in the list.

Multilevel lists

Multilevel lists allow you to create an outline with multiple levels. In fact, you can turn any bulleted or numbered list into a multilevel list by placing the insertion point at the beginning of a line and pressing the Tab key to change the level for that line. You can then use the Multilevel List command to choose the types of bullets or numbering that are used.

To create a multilevel list :

1. Place the insertion point at the beginning of the line you want to move.
2. Press the Tab key to increase the indent level of the line. The line will move to the right.

To remove numbers or bullets from a list, select the list, then click the **Bullets** or **Numbering** commands.

To change the level of a line:

1. Place the insertion point at the beginning of the line.
2. Press the Tab key to increase the level.
3. Hold Shift and press Tab to decrease the level.

Agenda

- ✧ Call to order
- ✧ New member introduction
- ✧ Treasurer's report
- ✧ News and events
- ✧ Announcement of Chair's retirement

Tables

A **table** is a grid of cells arranged in **rows** and **columns**. Tables can be customized and are useful for various tasks such as presenting text information and numerical data.

In Word, tables are useful for organizing and presenting data. You can create a blank table, convert text to a table, and apply a variety of styles and formats to existing tables.

The intersection of a row and column is called a cell.

This is a table.

This table has 2 columns	
	And 3 rows

To insert a blank table :

1. Place your insertion point where you want the table to appear, then select the **Insert** tab.
2. Click the Table command.
3. A drop-down menu containing a grid of squares will appear. Hover the mouse over the grid to select the number of columns and rows in the table.
4. Click the mouse, and the table will appear in the document.
5. You can now place the insertion point anywhere in the table to add text.

Monday	Tuesday	Wed		

To convert existing text to a table:

In this example, each row of information contains an **item name** and **price**, separated by tabs. Word can convert this information into a table, and it will use the tabs to separate the data into two columns.

1. Select the text you want to convert.
From the Insert tab, click the Table command.
2. Select Convert Text to Table from the drop-down menu.
3. A dialog box will appear. Choose one of the options in the Separate text at: section. This is how Word knows what text to put in each column.

4. Click OK. The text appears in a table.

Menu Items	828.45
Paper Items (Plates, silverware, cups)	135.15
Rental Equipment (Tables, chairs, linens)	277.75
Service Fee (18% of menu items ordered)	122.33
Total Cost	1,363.68

To add a row or column :

1. Hover the mouse near the location where you want to add a row or column, then click the **plus sign** that appears.

Menu Items	828.45
Paper Items (Plates, silverware, cups)	135.15
Rental Equipment (Tables, chairs, linens)	227.75
Service Fee (18% of menu items ordered)	122.33

2. A new row or column will appear in the table.

Menu Items	828.45
Paper Items (Plates, silverware, cups)	135.15
Rental Equipment (Tables, chairs, liners)	227.75
Service Fee (18% of menu items ordered)	122.33

You can also add rows below the insertion point. Follow the same steps, but select **Insert Rows Below** from the menu.

To add a column:

1. Place the insertion point in a column adjacent to the location where you want the new column to appear.
2. Right-click the mouse. A menu will appear.
3. Select **Insert** **Insert Columns to the Left** or **Insert Columns to the Right**. A new column appears.

Salesperson	Print	TV	Web
Jim M.	10,252	25,560	13,745
Beth W.	5,550	13,470	27,800
Luiz D.	8,547	17,555	8,907
Alice S	13,578	6,789	10,239

To delete a row or column:

1. Place the insertion point in the row or column you want to delete.
2. Right-click the mouse, then select Delete Cells... from the menu that appears.
3. A dialog box will appear. Select Delete entire row or Delete entire column, then click OK.

4. The column or row will be deleted.

To apply a table style:

1. Click anywhere on the table, then click the Design tab on the right side of the Ribbon.

2. Locate the Table Styles group, then click the More drop-down arrow to see all available table styles.

3. Select the desired style.

4. The selected table style will appear.

Category	Amount
Menu Items	828.45

Total	1,679.18

A Tick (3) the correct option.

(NEP) Analytical Skills

1. In MS-Word it is a series of items preceded by a bullet or number.

(a) Table	☐	(b) Alphabet and number	☐
(c) Bulleted and numbered	☐	(d) Multilevel	☐
2. This lists allow you to create an outline with multiple levels.

(a) Multiple	☐	(b) Multiple	☐	(c) Multilevel	☐	(d) Multilevel	☐
--------------	--------------------------	--------------	--------------------------	----------------	--------------------------	----------------	--------------------------
3. A table is a grid of cells arranged in:

(a) rows and columns	☐	(b) rows and columns	☐
(c) rows and columns	☐	(d) row and columns	☐
4. The intersection of a row and column is called a:

(a) Call	☐	(b) Cell	☐	(c) Square	☐	(d) Point	☐
----------	--------------------------	----------	--------------------------	------------	--------------------------	-----------	--------------------------

5. It is useful to compare information on different categories.

- (a) Cell ☐ (b) Bullet ☐ (c) List ☐ (d) Table ☐

B Fill in the blanks.

1. _____ are used for items that have no particular priority.
2. You can use the _____ command to choose the types of bullets or numbering that are used.
3. _____ can be customized and are useful for various tasks such as presenting text information and numerical data.
4. Table is a collection of related data in _____ and _____.
5. One of the ways to arrange items in the list is in _____ order.

C Write T for True or F for False.

1. When you want to organize lists in Word, you can format them as either bulleted or numbered lists. ☐
2. Word offers a variety of bullet options that allow you to customize your lists to suit your needs. ☐
3. The table helps us to easily remember instructions. ☐
4. List is useful to catch attention of the reader. ☐
5. To remove numbers or bullets from a list, select the list, then click the Bullets or Numbering commands. ☐

D Match the followings.

Insert row above

Insert column right

Insert column left

Table Style

Bullets

Border

Editing Features in MS-Word 2013

Lesson at a Glance

Header and Footer Spelling and Grammar & Thesaurus Find and Replace Tool

Header and Footer

Headers and Footers usually contain information like the document name, chapter name, page number and data.

- A header is a text that is printed at the top of the page in a document where as footer is printed at the bottom of each page.
- By default, headers are printed 0.5 inches from the top of the page and footers are printed 0.5 inches from the bottom of the page.

To create a header or footer:

In our example, we want to display the author's name at the top of each page, so we'll place it in the header.

1. Double-click anywhere on the top or bottom margin of your document. In our example, we'll double-click the top margin.

2. The header or footer will open, and a Design tab will appear on the right side of the Ribbon. The insertion point will appear in the header or footer.

3. Type the desired information into the header or footer. In our example, we'll type the author's name.

4. When you're finished, click **Close Header and Footer**. Alternatively, you can press the Esc key.

5. The header or footer text will appear.

Adding "Page Number" in the Footer area

Word can automatically label each page with a page number and place it in a header, a footer, or in the side margin. You can add page numbers to an existing header or footer; or you can insert page numbers into a new header or footer.

To add page numbers to a document :

In our example, we'll add page numbering to our document's footer.

1. Double-click anywhere on the header or footer to unlock it. If you don't already have a header or footer, you can double-click near the top or bottom of the page. The Design tab will appear on the right side of the Ribbon.

2. Click the Page Number command. In the menu that appears, hover the mouse over Current Position and select the desired page numbering style.

3. Page numbering will appear.

4. To edit the font, font size, and alignment of page numbers, select a page number and click the Home tab. Word's text formatting options will appear.

5. When you're finished, press the Esc key. The page numbering will be formatted.

Spelling and Grammar & Thesaurus

Microsoft Office Word program contains many tools that help you to check for spelling mistakes in your document.

It also has a tool to replace selected words.

Two of the tools are Spelling & Grammar and Thesaurus.

We use this tool to check if a selected word or sentence is properly written.

Thesaurus

Thesaurus is like a dictionary. We use this tool to verify the meaning of selected words.

Using the “Spelling and Grammar” tool.

To make our document error free, we have to make sure that it is free from spelling and grammar errors. Word has several options for checking spellings. We can run a spelling and grammar check, or we can allow Word to check our spelling automatically as we type.

To run a Spelling and Grammar check :

1. From the Review tab, click the Spelling & Grammar command.

2. The Spelling and Grammar pane will appear. For each error in your document, Word will try to offer one or more suggestions. You can select a suggestion and click Change to correct the error.

3. Word will move through each error until you have reviewed all of them. After the last error has been reviewed, a dialog box will appear confirming that the spelling and grammar check is complete. Click OK.

Must Know!

If no suggestions are given, you can manually type the correct spelling in your document.

Using the “Thesaurus” tool.

Thesaurus is a word dictionary which enables to look up synonyms, antonyms, word substitutes and alternative spelling of a particular text.

1. Open the file.

2. Select the word accuracy.

3. Click on the Review tab.
4. Click on the Thesaurus button.
5. The Research pane will open on the right of the window.

A list of similar words will be displayed in the Research pane.

You can replace the selected word in the text by one of the words from the list suggested.

- Place pointer on the word loop.
- Click on the drop down arrow to get a list of options.

8. Click on the Insert option

The word circle has now changed to loop.

9. Save and close the document.

Find and Replace tool

The Find and Replace tool is used to look for specific words in a document and if necessary, make changes to these words.

1. Open the file.
2. Click on the Replace button.
3. The Find and Replace dialog box will appear.

4. Type the word formed in the Find what text box and shaped in the Replace with text box.

5. Click on the Replace button.
6. Click on the Close button.
7. The word “formed” has been replaced by “shaped”.

A Tick (3) the correct option.

(NEP) Analytical Skills

1. Headers and Footers refer to information such as:

- | | | | |
|----------------|--------------------------|--------------------|--------------------------|
| (a) Name Title | ☐ | (b) Document Title | ☐ |
| (c) Book name | ☐ | (d) Image name | ☐ |

2. It is a text that is printed on the top of a page.

- | | | | | | | | |
|------------|--------------------------|-------------|--------------------------|-------------|--------------------------|--------------|--------------------------|
| (a) Footer | ☐ | (b) Endnote | ☐ | (c) Headers | ☐ | (d) Footnote | ☐ |
|------------|--------------------------|-------------|--------------------------|-------------|--------------------------|--------------|--------------------------|

3. We use this tool to check if a selected word or sentence is properly written.

- | | | | |
|------------------------|--------------------------|---------------|--------------------------|
| (a) Thesaurus | ☐ | (b) Translate | ☐ |
| (c) Spelling & Grammar | ☐ | (d) Research | ☐ |

4. It looks up synonyms, antonyms, word substitutes and alternative spelling of a text.

(a) Research

☐

(b) Grammar

☐

(c) Thesaurus

☐

(d) Language

☐

B Fill in the blanks.

1. _____ it contains information such as Document name, Dates and Page Numbers.

2. _____ is a text in the document that printed at the bottom of each page.

3. _____ is use to verify the meaning of selected words.

C Write T for True or F for False.

1. Text entered in the header or footer will appear on each page of the document.

☐

2. We can run a Find and Replace tool to check for spelling automatically as we type.

☐

3. The spelling and grammar tool is used to look for specific words in a document.

☐

D Answer the following questions.

1. What are Headers and footers?

2. What is the use of Spelling & Grammar tool?

3. What is Thesaurus?

4. What is Find and Replace?

LAB ACTIVITY

A Insert Headers, Footers, and Page Numbers

(NEP) Experimental Learning

You can add headers, footers and page numbers numerous ways. The simplest way is to double click on the top or bottom of the page and the header and footer area will appear. Enter the text you wish to be displayed at the top or bottom of every page.

B Add Page Numbers

If you want a page number on each page, you can quickly add a page number from the gallery.

1. On the Insert tab, in the Header & Footer group, click Page Number.
2. Click the page number location that you want.
3. In the gallery, scroll through the options, and then click the page number format that you want.
4. To return to the body of your document, click Close Header and Footer on the Design tab (under Header & Footer Tools).

Introduction
Applying Themes

Adding Picture in a Slide
Adding a Background

Adding Online Pictures
Changing Views

Introduction

MS PowerPoint is a presentation software that present information in a presentable format on series of slides. These slides can be projected, printed and published.

Importance of a Presentation

- Presentation can be viewed on a projector by attaching the computer.
- Presentation helps to show our information visually.
- Presentation imports the data from MS-Word, MS-Excel, MS-Paint etc.
- Presentation provides handouts, speaker notes and outlines.

Must Know!

A new presentation can be start by using Ctrl + N.

Adding Picture in a Slide

Adding picture to your presentation can be a great way to illustrate important information or add decorative accents to existing text. In PowerPoint you can insert a picture from file or finding online pictures or add a screenshots of your own. Once an image has been inserted, you can resize and move it to the location you want.

To insert a picture from a file:

1. Select the Insert tab, then click the Pictures command in the Images group.

2. A dialog box will appear. Locate and select the **desired image file**, then click **Insert**.

3. The picture will appear on the currently selected slide.

You can also click the Pictures command in a placeholder to insert images.

Adding Online Pictures

If you don't have the picture you want on your computer, you can find a picture online to add to your presentation. PowerPoint offers two options for finding online pictures :

- **OneDrive** : You can insert an image stored on your OneDrive (previously called SkyDrive). You can also link other online accounts with your Microsoft account, such as Facebook or Flic.

- Bing Image Search :** You can use this option to search the Internet for images. By default, Bing only shows images that are licensed under Creative Commons, which means you can use them for your own projects. However, you should go to the image's website to see if there are any restrictions on how it can be used.

To insert an online picture :

1. Select the Insert tab, then click the Online Pictures command.

2. The Insert Pictures dialog box will appear:
3. Choose Bing Image Search or your OneDrive. In our example, we'll use Bing Image Search.

4. Press the Enter key. Your search results will appear in the dialog box.
5. Select the desired image, then click Insert.

6. The image will appear on the currently selected slide.

Employee Fitness Center

- ▶ Flexible Hours
- ▶ Multiple TVs
- ▶ Group Classes
- ▶ New Machines

Applying Themes

You will need to know how to apply a theme and how to switch to a different theme if you want to use this feature to create presentations. All of the themes included in PowerPoint are located in the Themes group on the Design tab. Themes can be applied or changed at any time.

To apply a theme :

1. Select the Design tab on the Ribbon, then locate the Themes group. Each image represents a theme.
2. Click the More drop-down arrow to see all available themes.

3. Select the desired theme.

4. The theme will be applied to the entire presentation. To apply a different theme, simply select it from the Design tab.

Once you've applied a theme, you can also select a **variant** for that theme from the **Variants** group. Variants use **different theme colors** while preserving a theme's overall look. Some variants also use different **textures**, as in the example below.

Adding a Background

You can add a dramatic effect to your theme by applying a background.

To add a background:

- Select the Design tab, then click the Format Background command.

- The Format Background pane will appear on the right. Select the desired fill options. In our example, we'll use a Solid fill with a light gold color.

- The background style of the selected slide will update.
- If you want, you can click Apply to All to apply the same background style to all slides in your presentation.

Must Know!

On clicking Hide Background Graphics, the background of the slide disappears.
Short cut key to insert a new slide is Ctrl + M.

Changing Views

Because there are several phases of developing a presentation, PowerPoint provides several different views for you to choose from:

- **Normal View** : View the presentation in Normal view.
- **Slide Sorter View** : View the presentation in Slide Sorter view to easily rearrange slides.
- **Reading view**: View the presentation as a slideshow that fits within the window.
- **Play slide show** : This is the view you'll use to present to an audience. This command will begin the presentation from the current slide. You can also press F5 on your keyboard to start from the beginning. A menu will appear when you hover the mouse in the bottom-left corner. These commands allow you to navigate through the slides and access other features, such as the pen and highlighter.

Must Know!

Short cut key to save a presentation is Ctrl + S.

The extension of PowerPoint file is PPTX4.

think
over

Which view you will select to make a presentation to an audience?

Work Station

A Tick (3) the correct option.

(NEP) Analytical Skills

1. It lets you access common commands no matter which tab you are on in the Ribbon.

(a) Quick Access toolbar

☐

(b) Quick Menu toolbar

☐

(c) Quick View toolbar

☐

(d) Quick Home toolbar

☐

2. This tab allows you to view and work with the slides in your presentation.

(a) Outline

☐

(b) Normal

☐

(c) Slides

☐

(d) Slide show

☐

3. This tab conveniently displays the text content of each slide.

(a) View

☐

(b) Slide

☐

(c) Outline

☐

(d) Normal

☐

4. This view displays smaller versions of all of the slides in the presentation.

(a) Slide show

☐

(b) Normal

☐

(c) Slide Sorter

☐

(d) Outline

☐

5. This view is selected by default and shows the Slide and Outline tabs, along with displaying the current slide.

(a) Slide show

☐

(b) Normal

☐

(c) Slide Sorter

☐

(d) Outline

☐

B Fill in the blanks.

1. The slides in a presentation can be arranged in a _____.

2. Microsoft PowerPoint is an application software that is used to _____.

3. _____ is the view used for making presentations to an audience.

4. A _____ is asset of colours, fonts and special effects.
5. _____ view displays each slide on a full screen.

C Write T for True or F for False.

1. On slides you can use text, pictures, graphic, tables, sound and video. ☐
2. You can add, delete, duplicate, and rearrange slides in the outline tab. ☐
3. You can edit your text directly from the outline view. ☐
4. Reading view displays only the slides with buttons at the bottom of the screen for navigation. ☐
5. Slide Sorter Show will play your slides as an actual presentation. ☐

D Match the followings.

- | | |
|-------------------------|--|
| 1. Title bar | (a) Present in the middle of the window. |
| 2. Quick Access Toolbar | (b) A strip of buttons across the top of the main window. |
| 3. Ribbon | (c) Displays all the slides in a presentation in a miniature form. |
| 4. Blank Slide | (d) A collection of pictures and graphics files. |
| 5. Pictures | (e) Provides access to commands that are frequently used. |
| 6. Slide Sorter View | (f) Located at the top of the window. |

E Answer the following questions.

1. What is a presentation?

2. What are slides?

3. Define slide sorter view.

4. Describe normal view.

5. What is slide show?

Introduction to Flash CS3

6

Lesson at a Glance

Flash Start Page
Drawing Tools

Flash Workspace
Selecting Objects

Properties Inspector
Creating a Simple Logo

Panels

Flash is a multimedia graphics program specially for use on the website. It enables you to create interactive movies on the website. It uses vector graphics, which means that the graphics can be scaled to any size without losing clarity and quality.

Flash Start Page

1. Load Flash CS3 and the following START PAGE should be displayed.
2. The START page allows you to open saved files, start different types of files and obtain help with Flash.
3. Under the CREATE NEW section click on FLASH FILE (ACTIONSCRIPT 3.0) to start a new Flash document.

You will receive the FLASH SCREEN similar to the following diagram.

NOTE : It is personal choice whether you display the tools in one or two columns. They will be displayed in two columns.

Flash Workspace

There are two parts to the Flash workspace which is at the centre of the screen:

- The STAGE AREA which is the white area.
- The PASTEBOARD which is the grey area that surrounds the stage.

Only objects within the STAGE AREA are included in a movie. The PASTEBOARD is mainly used to allow objects to move onto the stage then off.

NOTE : This is what the shape would look like if we exported it from Flash.

Properties Inspector

The PROPERTIES INSPECTOR is one of the most used sections of the FLASH screen.

Double click in the shape to select all its parts and press the DELETE key to remove it from the screen.

Panels

Flash provides all the tools needed to create animations in a series of panels that are displayed around the stage and work areas. There are basically five different panel sections.

The Tools Panel

The TOOLS panel runs down the left of the screen and it has four sections. The DRAWING tools, the VIEW tools, the COLOUR tools and the tool OPTIONS.

The DRAWING tools are the standard drawing tools that most graphics programs provide. They allow you to create and edit objects.

The VIEW tools comprise the HAND tool which is used to scroll around the screen and the ZOOM tool which is used to magnify sections of the screen.

The COLOUR tools are used to set the FILL or LINE(STROKE) colours of objects.

The TOOL OPTIONS provide extra options for some of the DRAWING tools.

Drawing Tools

Before creating Flash animations you need to be aware of the different Drawing Tools that Flash provides. You've already used the oval, rectangle and line tools. Here you will concentrate on some of the other drawing tools and techniques that are available in Flash.

Cookie Cutting

Cookie Cutting causes one object to replace part or all of another object when it is placed over the first object. Most vector drawing programs keep each drawn object as a separate entity, but Flash treats objects differently. The object that is drawn first is at the back of the stage. The next object that is drawn is stacked above the first and any part of the first object that is covered by the second is erased. Flash uses Cookie Cutting to help reduce the size of files.

1. Load Flash and create a new FLASH FILE (ACTIONSCRIPT 3.0) or close the current file and start a new FLASH FILE.

NOTE : When you draw an oval or rectangle in Flash the shape has two parts, a fill and a border.

NOTE : This is what is meant by COOKIE CUTTING - the red oval cookie has cut the yellow circle cookie. It is a good way of creating a half moon shape.

The remaining part of the oval border should still be selected, press the DELETE key to remove it.

Selecting Objects

As you have seen when you draw circles or rectangles they have both a border and a fill section. There are a number of ways of selecting each.

4. Select UNDO by pressing CTRL+Z to return the border to the fill.

7. Try moving the object and both the fill and border should move.
8. Press the DELETE key to delete the half moon shape.

Selection Tool

You have used the SELECTION TOOL to select or move shapes. It can also be used to modify shapes.

1 Set the SHAPES tool to the RECTANGLE TOOL and draw a rectangle near the top left of the stage.

2 Select the SELECTION TOOL and move the pointer over the bottom border until an arc is added to the pointer.

3 Drag the border towards the centre of the rectangle and the border should be converted into a curve.

4 Try dragging the top border out into a curve.

5 You can drag corners to alter the shape. Move the pointer over the top right corner (it should have a corner added to it) and drag it to the right.

6. You can break lines that intersect at a corner into two. If the line is straight the two created lines will be straight. If the line is curved the two created lines will be curved.

Symbols, Libraries and Layers

In this topic you will look at creating symbols, using the Library panel and using layers.

These tools are vital when creating animations. They reduce the size of files and help you organise the assets used in an animation.

Creating a Simple Logo

A simple logo will be created using the rectangle, circle and text tools.

A. Drawing a Circle

1. Load Flash and create a new FLASH FILE, or close the current file and start a new FLASH FILE.

NOTE : By setting the *STROKE* to *NO STROKE* the circle will simply have a fill colour and no border.

NOTE : The *SHIFT* key causes a perfect circle to be drawn rather than an oval.

B. Adding a Rectangle

C. Placing the Rectangle Over the Circle

The rectangle and circle will be combined.

NOTE: You can use the *ARROW* keys to nudge the rectangle into place.

NOTE : You can press **CTRL+Z** on the Windows system as many times as required to **UNDO** any previous steps if you are not happy with the logo so far, then try the steps again.

D. Adding Text to the Logo

To complete the logo some text will be added inside the rectangle.

NOTE : You can use the 'handle' at the top right of the text frame to lengthen the text frame when needed.

NOTE : Text is not combined into other shapes so at the moment you have two objects on the stage.

5. Return the ZOOM to 100%.
6. Save the file in your STORAGE folder under the name: Logo

E. Duplicating the Logo

Now that the logo is complete it can be duplicated, resized, modified, etc.

Work Station

A Tick (3) the correct option.

(NEP) Analytical Skills

1. Adobe Flash CS3 is a multimedia graphics program especially for :
(a) Movies ☐ (b) Cartoons ☐ (c) Games ☐ (d) Web pages ☐
2. It is mainly used to allow objects to move onto the stage then off.
(a) Design area ☐ (b) Stage ☐ (c) Pasteboard ☐ (d) Field ☐
3. This is one of the most used sections of the flash screen.
(a) Properties windows ☐ (b) Properties field ☐
(c) Properties inspector ☐ (d) Properties area ☐
4. This panel runs down the left of the screen and it has four sections.
(a) File panel ☐ (b) Field panel ☐ (c) Tools panel ☐ (d) Stage panel ☐
5. Only objects within this area are included in a movie.
(a) File area ☐ (b) Tool area ☐ (c) Window area ☐ (d) Stage area ☐

B Fill in the blanks.

1. By setting the _____ the circle will simply have a fill colour and no border.
2. There are two parts to the Flash workspace: _____ and _____.
3. _____ tools allow you to create and edit objects.
4. The _____ tools comprise the _____ tool which is used to scroll around the screen.
5. _____ causes one object to replace part or all of another object when it is placed over the first object.

C Write T for True or F for False.

1. The Drawing Tool can also be used to modify shapes. ☐
2. The drawing tools are used to set the fill or line colours of objects. ☐
3. The tool options provide extra options for some of the drawing tools. ☐
4. It is advisable to save your Flash files in a separate folder. ☐
5. The drawing tools are the standard drawing tools that most graphics programs provide. ☐

D Answer the following questions.

1. Write down the use of Adobe Flash CS3.

2. Explain the Flash Workspace.

3. What are Panels?

4. Explain the Tools Panel.

5. Define Drawing Tools.

6. What is Cookie Cutting?

7. Write the use of Selection Tool.

8. Define Symbols, Libraries and Layers.

Introduction to HTML

Lesson at a Glance

Introduction
HTML Tags

Tags
Paragraph Tag

Creating HTML File
Formatting in HTML

Introduction

HTML (Hyper Text Markup Language) Language used for creating and designing web pages. In HTML language, codes are used to describe the content format and layout of a web page. HTML codes have an ability to group together text, picture, sound, animation video and links on a single web page.

Tags

A tag is a inbuilt coded HTML command that convey a special meaning which defines the structure and appearances of a web page. Tags are also known as keywords enclosed between the angle brackets (< >). Most of the tags are usually used in pairs, i.e. starting tag <HTML> and closing tag </HTML> etc. Tags are of two types :

Container tags Empty tags

For example: The bold command is like this

 Bold text

Creating HTML File

Type the text in any text editor like notepad, word pad etc.

Just follow the steps for creating a new document.

Step 1 : Open a text editor like Notepad.

Step 2 : Choose new from file menu to create a new blank document.

Step 3 : Type the text to create HTML content.

Step 4 : Choose save option of file menu and click on it.

Step 5 : Give the name as A and give with .htm or .html extension.

Step 6 : Click on save button.

Now, you run it in any web browser.

Just follow the given steps:

Step 1 : Open the web browser like internet explorer.

Step 2 : Open the file menu and click on open option.

Step 3 : Select the file which you have created in WordPad.

Step 4 : Click on open button.

Now, A .htm displayed on the screen.

HTML Tags

In this topic we will cover the explanation of layout of HTML document and some basic tags. The basic tags of HTML are as follows :

```
<HTML></HTML>
<HEAD></HEAD>
<TITLE></TITLE>
<BODY></BODY>
```

These are the required tags and all HTML documents must have these basic tags. Here is the explanation of these tags.

<HTML></HTML>

The first pair of tags are the HTML tags themselves. You put one HTML tag at the top, and one at the bottom:

```
<HTML>
</HTML>
```

This tells a browser like Internet Explorer or Firefox that the code is Hyper Text Markup Language.

Two things to notice here. One, that the word HTML is surrounded by angle brackets (the Less Than and Greater Than keys on your keyboard); and two that the second Tag has a forward slash before the HTML.

All your tags must be surrounded by the angle brackets <>. This tells the browser that there is some HTML code that needs executing, and that it is not to be shown on the web page. Miss an angle bracket out and it can really mess up your web page.

<HEAD></HEAD>

The first Tag tells the browser to start doing something; the second tag tells the browser to stop doing it. The stop symbol is that forward slash.

The next pair of tags are the HEAD tags: They go between the two HTML ones:

```
<HTML>
    <HEAD>
    </HEAD>
</HTML>
```

Again, notice that both the HEAD tags are surrounded by angle brackets, and there is a forward slash before the final one </HEAD>.

The HEAD section of HTML page is where you put special instructions for the browser. Your browser will not print directly to a web page when things are inserted into the HEAD section.

<TITLE></TITLE>

A special instruction your browser can understand is the TITLE tag:

<TITLE></TITLE>

The Title tag always goes in the HEAD section of the HTML skeleton.

Whatever you type between the two TITLE tags is what appears at the very top of your browser window.

<Body></Body>

```
<HTML>
  <HEAD>
    <TITLE> <TITLE>
  </HEAD>
  <BODY>
```

The final, and most important part, of the HTML skeleton is the BODY section.

```
    </BODY>
  </HTML>
```

In between those two BODY tags is where you'll write most of your HTML code. When you type something between the two BODY tags and then view the results in a browser, whatever you typed will be displayed.

A screenshot of a Notepad window titled 'a - Notepad'. The window contains the following HTML code:

```
<HTML>
<HEAD>
<TITLE>
FIRST Page
</TITLE>
</HEAD>
<BODY>
HEY,
I AM MANI.
HELLO, HOW ARE YOU?
</BODY>
</HTML>
```

The code when executed via a web browser will create a page as shown in above figure.

Adding Paragraph

In HTML if you want to start a new paragraph, you have to use the P tags.

You have to use the P tags whenever you want to start a new paragraph.

Strictly speaking, though, you don't need the closing P tag. You can just do this to start a new paragraph:

```
firstwebpage.html - Notepad
File Edit Format View Help
<!DOCTYPE HTML>
<HTML>
  <HEAD>
    <TITLE>My First Page</TITLE>
  </HEAD>
  <BODY>
    <H3>A Size 3 Heading</H3>
    <P>To be, or not to be: that is the question:
    whether 'tis nobler in the mind to suffer the
    slings and arrows of outrageous fortune, or to take
    arms against a sea of troubles, and by opposing end
    them? </P>
    <P>To die: to sleep; no more; and by a sleep to say
    we end the heart-ache and the thousand natural
    shocks that flesh is heir to, 'tis a consummation
    devoutly to be wish'd.</P>
  </BODY>
</HTML>
```

Save your work and view the results in your browser. You should see this:

The
break tag

The BR tag is used when you don't want a full paragraph break. The space between lines of text is then reduced. The BR tag doesn't need a closing tag, and can be just by itself.

As an example, add the following to the end of your text (the BR part).

<P>To die: to sleep; no more; and by a sleep to say we end the heart-ache and the thousand natural shocks that flesh is heir to, 'tis a consummation devoutly to be wish'd.

... Rest of Hamlet's Soliloquy goes here

</BODY></HTML>

Save your changes and switch to your browser. Press F5 to refresh the page and the results should look like this:

Formatting in HTML

Those of you who have worked on any word processor knows what formatting of the text is. Using this concept you make the text more presentable by making Bold, italic, underline, size etc.

(a) Fonts :

Fonts play very important role in making a website more user friendly and increasing content readability.

The font tag is having three attributes called size, color, and face to customize your fonts. To change any of the font attributes at any time within your webpage, simply use the tag. The text that follows will remain changed until you close with the tag. You can change one or all of the font attributes within one tag.

Set Font Size

You can set content font size using size attribute. The range of accepted values is from 1(smallest) to 7(largest). The default size of a font is 3.

Example :

```
<html>
<head>
<title>Setting Font Size</title>
</head>
<body>
<fontsize="1">Font size="1"</font><br>
<fontsize="2">Font size="2"</font><br>
<fontsize="3">Font size="3"</font><br>
<fontsize="4">Font size="4"</font><br>
<fontsize="5">Font size="5"</font><br>
<fontsize="6">Font size="6"</font><br>
<fontsize="7">Font size="7"</font>
</body>
</html>
```

This will produce following result:

Font size="1"
Font size="2"
Font size="3"
Font size="4"
Font size="5"
Font size="6"
Font size="7"

Setting Font Face

You can set font face using *face* attribute but be aware that if the user viewing the page doesn't have the font installed, they will not be able to see it. Instead user will see the default font face applicable to the user's computer.

Example :

```
<html>
<head>
<title>Font Face</title>
</head>
<body>
<fontface="Times New Roman"size="5">Times New Roman</font><br>
<fontface="Verdana"size="5">Verdana</font><br>
<fontface="Comic sans MS"size="5">Comic Sans MS</font><br>
<fontface="WildWest"size="5">WildWest</font><br>
<fontface="Bedrock"size="5">Bedrock</font><br>
</body>
</html>
```

This will produce following result:

Times New Roman
Verdana
Comic Sans MS
WildWest
Bedrock

Setting Font Color

You can set any font color you like using *color* attribute. You can specify the color that you want by either the color name or hexadecimal code for that color.

Note : You can check a complete list of HTML Color Name with Codes.

Example :

```
<html>
<head>
<title>Setting Font Color</title>
</head>
<body>
```

```
<fontcolor="#FF00FF">This text is in pink</font><br>
<fontcolor="red">This text is red</font>
</body>
</html>
```

This will produce following result :

This text is in pink

This text is red

The <basefont> Element

The <basefont> element is supposed to set a default font size, color, and typeface for any parts of the document that are not otherwise contained within a tag. You can use the elements to override the <basefont> settings.

Example :

```
<html>
<head>
<title>Setting BasefontColor</title>
</head>
<body>
<basefontface="arial, verdana, sans-serif"size="2"color="#ff0000">
<p>This is the page's default font.</p>
<h2>Example of the &lt;basefont&gt; Element</h2>
<p><fontsize="+2"color="darkgray">
This is darkgray text with two sizes larger
</font></p>
<p><fontface="courier"size="-1"color="#000000">
It is a courier font, a size smaller and black in color.
</font></p>
</body>
</html>
```

This will produce following result :

This is the page's default font.

Example of the <basefont> Element

This is darkgray text with two sizes larger

It is a courier font, a size smaller and black in color.

(b) Making Bold and Italic:

Two more tags that come in useful are the Bold and Italic tags. They are quite easy to use. Here are the Bold tags:

And here are the Italic tags:<i></i>

The text you want to change goes between the two tags:

 ... Rest of Hamlet's Soliloquy goes here

<i> ... Rest of Hamlet's Soliloquy goes here</i>

If you want Bold and Italic text then you can nest the two:

<i> ... Rest of Hamlet's Soliloquy goes here</i>

Try it in your HTML code:

```
firstwebpage.html - Notepad
File Edit Format View Help
<!DOCTYPE HTML>
<HTML>
  <HEAD>
    <TITLE>My First Page</TITLE>
  </HEAD>
  <BODY>
    <H3>To Be Or Not To Be</H3>
    <P>To be, or not to be: that is the question:
    whether 'tis nobler in the mind to suffer the slings and
    arrows of outrageous fortune, or to take arms against a
    sea of troubles, and by opposing end them?</P>
    <P>To die: to sleep; no more; and by a sleep
    to say we end the heart-ache and the thousand natural shocks
    that flesh is heir to, 'tis a consummation devoutly to be
    wish'd.
    <BR>
    <B><I>... Rest of Hamlet's Soliloquy goes here</I></B>
  </BODY>
</HTML>
```

Save and view the results in your browser:

A Tick (3) the correct option.

(NEP) Analytical Skills

- By using this language you can create a website.
 (a) Xml ☐ (b) HTML ☐ (c) WWW ☐ (d) HTNL ☐
- This section of HTML page is where you put special instructions for the browser.
 (a) HTML ☐ (b) TITLE ☐ (c) BODY ☐ (d) HEAD ☐
- This tag always goes in the HEAD section of the HTML skeleton.
 (a) HTML ☐ (b) TITLE ☐ (c) BODY ☐ (d) HEAD ☐
- The final, and most important part, of the HTML skeleton is the:
 (a) HTML ☐ (b) TITLE ☐ (c) BODY ☐ (d) HEAD ☐
- In HTML if you want to start a new paragraph, you have to use this tag:
 (a)
 ☐ (b) <I> ☐ (c) <HR> ☐ (d) <P> ☐
- This tag is used when you don't want a full paragraph break.
 (a)
 ☐ (b) <I> ☐ (c) <HR> ☐ (d) <P> ☐

B Fill in the blanks.

- _____ is the most widely used language on Web to develop web pages.
- HTML stands for _____.
- HTML tags are written within the _____ and _____ sign.
- A special instruction your browser can understand is the _____ tag.
- You can use a _____ tag to set all of your text to the same size, face, and color.
- If you want Bold and Italic text then you can use: _____ and _____.

C Write T for True or F for False.

- Html is a tag based language that contains only the tags. ☐
- Mostly all values should be enclosed in straight quotation marks "-----". ☐
- The first Tag tells the browser to start doing something; the second tag tells the browser to stop doing it. ☐
- You have to use the
 tags whenever you want to start a new paragraph. ☐
- The BR tag doesn't need a closing tag, and can be just by itself. ☐
- You can set font face using style attribute. ☐

D Answer the following questions.

1. What is HTML?

2. What are tags?

3. What are the basic tags of html?

4. What are formatting tags in HTML?

5. What are fonts?

6. Write short notes on given tags: <P>,
, , <I>

LAB ACTIVITY

1. (a) Type the following in Notepad,

<HTML>

<HEAD>

<TITLE> MY FIRST WEB PAGE </TITLE>

</HEAD>

<BODY>

A web page is collection of Text, Images, sound, movie, etc.

</Body>

</HTML>

(NEP) Experimental Learning

(b) Save the file as "Webpage. html" in MY DOCUMENTS folder.

(c) Open Internet Explorer software.

(d) Open the file which you have created and saved in MY DOCUMENTS folder.

2. Write the HTML coding of given text.

Twinkle, twinkle, little star,
How I wonder what you are!
Up above the world so high,
Like a diamond in the sky.

Introduction to E-mail

Lesson at a Glance

Introduction	Advantages of E-mail	Creating an E-mail Account
How to send an E-mail	Signing out from E-mail	Replying to an E-mail
Forwarding an E-mail	Opening an E-mail Attachment	
Sending an E-mail Attachment		

Introduction

E-mail is the exchange of computer stored messages by telecommunications. You can also send non-text files, such as graphic images and sound files, as attachments. E-mail can also be exchanged between online service users and in networks other than the Internet, both public and private. E-mail can be distributed to lists of people as well as to individuals. Example of E-mail are : Gmail, Yahoo, Hotmail etc.

Advantages of E-mail

- E-mail can be sent from any part of the world.
- Cost of sending and receiving E-mail is free of cost.
- In E-mail anyone can send images and any type of file as attachment.
- An E-mail can be sent to multiple people at the same time.

Creating an E-mail Account

1. Open web browser.
2. Type gmail.com on the address bar and press Enter.
3. Click on SIGN IN.
4. Type the email address that has been given to you by your teacher.
5. Click on Next.

6. Type your password.

7. Click on Sign in.

The following screen appears. This is the **Inbox**.

Unread emails are in **bold**.

8. Click on the subject to open the email.

The following screen appears.

9. Click on the Back arrow to go back to the Inbox.

All read emails are no longer in **bold**.

How to Send an E-mail

Before sending an email, you must compose it. To compose an email means to write it.

1. Repeat steps 1 to 7 in Activity 1 to sign in.
2. Click on COMPOSE.

The new message box appears.

3. In the To box, type the email address of the recipient, that is the person to whom you want to send the email.

Make sure to enter the address correctly.

If even one character is wrong, the email will not be sent.

4. Type the subject of the email in the Subject box.
5. Type the following message in the body of the email.

6. Click on Send. Your email has now been sent to the recipient.

Signing out from E-mail

1. Click on Signout.

Replying to an E-mail

1. Sign in to your email.

- Open the email My first email by clicking on it.

The following screen appears.

- Click on Reply.

Note : Scroll down if the reply box does not appear on the screen.

- Enter the following message in the Reply box.

- Click on Send.

Forwarding an E-mail

- Sign in to your email.
- Open the email My first email.

The following screen appears.

- Click on Forward.

Note : Scroll down if the reply box does not appear on the screen.

4. Enter the email address of the person(s) you want to forward the email in the To box.
5. Click on Send.

Opening an E-mail Attachment

Attachments are files sent by email.

Email that has a paperclip icon contains an attachment.

1. Sign in to your email.

2. Click on the email My first attachment to open it.
3. The following screen appears.

4. Click on the attachment to open it.
The following window appears.

- Click the back arrow to return to the email.

Sending an E-mail Attachment

- Sign in to your email account to compose a new email.
- Enter an email address and the subject.
- Type the following message.

- Click on the paperclip icon to add an attachment.
- The following window appears.

6. Click on Desktop.
7. Scroll down and click on the MS Word document Attachment.
8. Click on **Open**.
9. The name of the document and a progress bar appears at the bottom of the new mail window.

Note : The attachment can be removed by clicking on x.

10. When the attachment is complete the progress bar will disappear.
11. Click on Send.

12. Click on Sent Mail to check if the mail has been sent.

The **paperclip** icon shows that the email has an attachment.

A Tick (3) the correct option.

(NEP) Analytical Skills

1. It is used to send messages to one or a group of persons using the Internet.

(a) E-letter ☐ (b) E-Note ☐ (c) E-Page ☐ (d) E-mail ☐

2. It means to start your email account to compose a new email.
 (a) Sign out ☐ (b) Sign in ☐ (c) Compose ☐ (d) Start ☐
3. To write an email click on.
 (a) Forward ☐ (b) Compose ☐ (c) Sent mail ☐ (d) Draft ☐
4. Enter the email address of the person you want to forward the email in the:
 (a) Reply ☐ (b) Compose ☐ (c) Forward ☐ (d) To box ☐
5. This icon shows that the email has an attachment.
 (a) Papernote ☐ (b) Paperclip ☐ (c) Papertip ☐ (d) Paperbox ☐

B Fill in the blanks.

1. An email can contain documents, _____ and _____ files.
2. You can use one of the following _____, _____, _____ to send emails.
3. Type _____ on the address bar and press Enter to open email.
4. In the _____, type the email address of the recipient that is the person to whom you want to send the email.
5. The _____ and a _____ appears at the bottom of the new mail window.

C Write T for True or F for False.

1. Emails can be sent to one person at once. ☐
2. Emails can be sent at any time. ☐
3. Attachments are files sent by email. ☐
4. Email that has a clip icon contains an attachment. ☐
5. Before sending an email, you must compose it. ☐

D Answer the following questions.

1. What is email?

2. Write some advantages of emails.

3. What do you mean by Compose?

4. What is the use of To box?

5. What is the use of paper clip icon?

W o r k s h e e t

- Label the E-mail window.
